SAMPLING AND DETERMINATION OF DEFECTS.

3. In the determination of the grade of maize the following methods of testing shall be used:—

- (a) *Sampling*.—Samples of maize to be graded shall be taken in such manner so as to be representative of such maize.
- (b) *Determination of Defective Maize Kernels*.—The percentage of defective maize kernels shall be determined by screening a sample of one hundred grammes [taken in the manner prescribed in paragraph (a)] through a screen with quarter-inch round holes and by hand-picking the remaining portion and by calculating the weight of the defective maize kernels thus hand-picked together with that of the pieces of maize kernels and maize kernels which passed through the screen as a percentage of the total weight of the sample.
- (c) *Determination of Other Coloured Maize Kernels*.—The percentage of other coloured maize kernels shall be determined by separating by hand from a sample of two hundred grammes [taken in the manner prescribed in paragraph (a)] the other coloured maize kernels and by calculating the weight of such other coloured maize kernels as a percentage of the total weight of the sample.

- (d) *Bepaling van vreemde voorwerpe.*—Die persentasie vreemde voorwerpe word bepaal deur 'n monster van tweehonderd gram [geneem op die wyse in paragraaf (a) voorgeskryf] met die hand uit te soek en die gewig van sodanige vreemde voorwerpe as 'n persentasie van die totale gewig van die monster te bereken.
- (e) *Bepaling van verrooide mieliepitte.*—Die persentasie verrooide mieliepitte word bepaal deur 'n monster van honderd gram [geneem op die wyse in paragraaf (a) voorgeskryf] met die hand uit te soek en die gewig van sodanige verrooide mieliepitte as 'n persentasie van die totale gewig van die monster te bereken.

VORM EN GROOTTE VAN PITTE.

4. Onreëlmatigheid in die vorm en grootte van mieliepitte beïnvloed nie die gradering daarvan nie.

GEBREEKTE MIELIEPITTE.

5. Mieliepitte waarvan stukkies afgebreek is, gebarste mieliepitte of stukkies van mieliepitte wat gesond is en wat in 'n monster mielies voorkom, moet nie by die toepassing van hierdie regulasies as gebreklike mieliepitte beskou word nie, uitgesonderd in die geval van mieliepitte en stukkies mieliepitte wat deur 'n kwartduimrondegatsif sal gaan.

BEPALING VAN GEWIGTE.

6. Die skaal wat gebruik word vir die bepaling van die gewig van 'n monster mielies of van die mieliepitte van 'n ander kleur of van verrooide mieliepitte of gebreklike mieliepitte of van vreemde voorwerpe in die monster, moet sodanig wees dat die betrokke gewigte tot binne 'n halfgram presies bepaal kan word.

INSPEKSIE EN BRANDMERK.

7. Elke besending mielies, bestem vir uitvoer, moet by die uitvoerhawe geïnspekteer word deur 'n inspekteur wat ingevolge artikel elf van die Wet op Uitvoer van Landbouprodukte, 1959 (Wet No. 10 van 1959), aangewys is en indien die betrokke mielies—

- (a) na die mening van die inspekteur voldoen aan die grade in hierdie regulasies voorgeskryf;
 - (b) nie in 'n oond gedroog is nie; en
 - (c) nie kalanderbесmet is nie;
- moet hy die houers daarvan brandmerk met die merk G.I.P.: Met dien verstande dat mielies ten opsigte waarvan 'n sertifikaat ingevolge regulasie 8 uitgereik is, nie aldus brandmerk hoeft te word nie.

SERTIFISERING.

8. Ten opsigte van mielies wat vir uitvoer bestem is en wat—

- (a) na die mening van die inspekteur voldoen aan die grade in hierdie regulasies voorgeskryf;
 - (b) nie in 'n oond gedroog is nie; en
 - (c) nie kalanderbесmet is nie;
- mag die inspekteur in regulasie 7 genoem, 'n sertifikaat uitrek in die vorm uiteengesit in Aanhangsel A hiervan en die sertifikaat moet by vertoning van die ladingsbrief aan die verskeper oorhandig word.

INSPEKSIEFOOI.

9. Ten opsigte van mielies wat vir uitvoer bestem is en wat geïnspekteer is, moet 'n bedrag bereken teen 0·278 cent per 200 lb. aan die Suid-Afrikaanse Spoorweë en Hawensadministrasie deur die uitvoerder of sy verteenwoordiger betaal word: Met dien verstande dat nie minder as 0·278 cent per houer mielies betaal word nie.

- (d) *Determination of Foreign Matter.*—The percentage of foreign matter shall be determined by separating by hand from a sample of two hundred grammes [taken in the manner prescribed in paragraph (a)] the foreign matter and by calculating the weight of such foreign matter as a percentage of the total weight of the sample.

- (e) *Determination of Pinned Maize Kernels.*—The percentage of pinned maize kernels shall be determined by separating by hand from a sample of one hundred grammes [taken in the manner prescribed in paragraph (a)] the pinned maize kernels and by calculating the weight of such pinned maize kernels as a percentage of the total weight of the sample.

SHAPE AND SIZE OF KERNELS.

4. Irregularity in the shape and size of maize kernels shall not affect the grading thereof.

BROKEN MAIZE KERNELS.

5. Chipped or cracked maize kernels or pieces of maize kernels which are in sound condition and which appear in a sample of maize, shall not be regarded as defective maize kernels under these regulations, except in the case of maize kernels and pieces of maize kernels which will pass through a quarter-inch round-hole screen.

DETERMINATION OF WEIGHTS.

6. The scale used for the determination of the weight of a sample of maize or of other coloured maize kernels or of pinned maize kernels or of defective maize kernels or of foreign matter in the sample shall be such that the relevant weights can be accurately determined to within one-half of a gramme.

INSPECTION AND BRANDING.

7. Every consignment of maize intended for export shall be inspected at the port of export by an inspector designated in terms of section eleven of the Agricultural Produce Export Act, 1959 (Act No. 10 of 1959), and if the maize concerned—

- (a) in the opinion of the inspector conforms to the grades specified in these regulations;
- (b) has not been kiln dried; and
- (c) is not weevily;

such inspector shall brand the containers thereof with the mark G.I.P.: Provided that maize in respect of which a certificate has been issued in terms of regulation 8 need not be so branded.

CERTIFICATION.

8. In respect of all maize intended for export and which—

- (a) in the opinion of the inspector conforms to the grades specified in these regulations;
- (b) has not been kiln dried; and
- (c) is not weevily;

the inspector referred to in regulation 7 may issue a certificate in the form set out in Annexure A hereto and such certificate shall be delivered to the shipper on production of the bill of lading.

INSPECTION FEE.

9. In respect of maize intended for export which has been inspected, an amount calculated at 0·278 cent per 200 lb. shall be paid to the South African Railways and Harbours Administration by the exporter or his representative: Provided that not less than 0·278 cent shall be paid per container of maize.

BEPALING VAN VOGGEHALTE.

10. Vir die doel van 'n proklamasie ingevolge paraaf (c) of (d) van subartikel (1) van artikel *six* van die Wet op Uitvoer van Landbouprodukte, 1959 (Wet No. 10 van 1959), moet die voggehalte van mielies bepaal word volgens die Marconi-elektriese weerstandsmetode of die Brown-Duvel-metode soos hieronder uiteengesit:—

(a) *Marconi-elektriese weerstandsmetode.*—Die apparaat vir die bepaling van voggehalte volgens hierdie metode moet bestaan uit die Marconi-vogmeter Model T.F. 933 of T.F. 933A, waardeur vog in die mielies deur middel van elektriese weerstand bepaal word. Die apparaat moet weg van 'n trek en direkte sonlig geplaas word in 'n vaste posisie in 'n kamer of skuur waar alle vogbepalings uitgevoer moet word. 'n Celsius-termometer moet aan die buitekant van die instrumentkas van die apparaat aangeheg word sodat die termometerbol ten volle blootgestel is aan die vry lug in die kamer of skuur.

'n Hoeveelheid van minstens 70 en hoogstens 80 gram van 'n verteenwoordigende monster van die mielies waarvan die voggehalte getoets moet word, moet in 'n handgraanmeul of koffiemeul gemaal word wat so gestel is dat minstens 90 persent van die gemaalde produk volgens gewig, deur 'n 10-maashandsif en hoogstens 75 persent daarvan volgens gewig deur 'n 20-maashandsif sal gaan. (Hierdie resultaat kan gewoonlik verkry word deur die meulplate so styf moontlik deur middel van die stelskroef vas te draai en die stelskroef dan ongeveer 'n kwartdraai los te draai.) Die meul moet egalig gedraai word teen so 'n spoed dat die hele monster in 'n tydperk van minstens 30 sekondes en hoogstens 90 sekondes gemaal sal word. Die gemaalde monster moet onmiddellik na 'n glasfles met 'n skroefdeksel en met 'n inhoudsmaat van tussen 300 en 400 kubiese sentimeters oorgeplaas word. Nadat die fles toegeskroef is, moet die inhoud deeglik vermeng word deur die fles vir minstens 30 sekondes te skud. Onmiddellik daarna moet die toetsel van die Marconi-apparaat omrent halfvol gemaak word met die gemaalde monster en die metaaldrukprop daarop in posisie geplaas word. Daar moet gesorg word dat die monster gelyk in die sel lê en dat die onderdele van die sel behoorlik inmekaar pas, en die sel moet slegs aan die buitenste isolermateriaal daar om, gehanteer word. Onmiddellik daarna moet die sel (met die metaaldrukprop na bo) in die klamp wat deel van die Marconi-apparaat uitmaak, geplaas en daarin vasgeskroef word totdat die twee dele van die silindervormige veeromhulsel wat met die skroef verbind is, bo gelyk is. Die klamp met die sel daarin vasgeskroef, moet korrek met die hooftoestel elektries verbind wees. Die skakelaar moet nou na die „zero“-posisie gedraai word, en daarna moet die galvanometernaald deur middel van die stelknoppie bokant die wyserskywe gestel word totdat die naald presies regoor die horizontale strepie te staan kom. Wanneer hierdie „zero“ instelling gemaak word, moet die linkerhandse wyserskywe op een van die posisies 1 tot 5 staan. Die skakelaar moet daarna na die „lees“-posisie gedraai word en die wyserskywe onmiddellik daarna gestel word totdat die galvanometernaald terugkeer na die posisie regoor die horizontale strepie. Die lesing op die wyserskywe moet nou geneem en die temperatuur op die termometer wat aan die hooftoestel geheg is, tot die naaste graad afgelees word. Enige geleidelike verskuiwing van die naald nadat dit aanvanklik korrek ingestel is, moet buite rekening gelaat word. Van die oomblik af wanneer die monster in die sel geplaas word totdat die finale lesing op die wyserskywe geneem word, mag hoogstens een minuut verloop. Waar moontlik moet lesings slegs op die swart of positiewe

DETERMINATION OF MOISTURE CONTENT.

10. For the purpose of a proclamation in terms of paragraph (c) or (d) of sub-section (1) of section *six* of the Agricultural Produce Export Act, 1959 (Act No. 10 of 1959), the moisture content of maize shall be determined by either the Marconi electrical resistance method or the Brown-Duvel method as set out below:—

(a) *Marconi Electrical Resistance Method.*—The apparatus for moisture determination according to this method shall consist of the Marconi moisture meter model T.F. 933 or T.F. 933A by which moisture in maize is determined through electrical resistance. The apparatus shall be placed away from draughts and the direct rays of the sun in a permanent position in a room or store where all moisture determinations shall be carried out. A centigrade thermometer shall be attached to the outside of the instrument case of the apparatus so that the thermometer bulb is fully exposed to the free air in the room or store. A quantity of not less than 70 and not more than 80 grammes of a representative sample of the maize to be tested for moisture shall be ground in a hand grain mill or coffee mill which has been so adjusted that at least 90 per cent by weight of the milled product will pass through a 10-mesh hand sieve and not more than 75 per cent by weight thereof will pass through a 20-mesh hand sieve. (This result can generally be obtained by adjusting the milling plates as tightly as possible by means of the adjusting screw and then by loosening the latter about one-quarter turn.) The mill shall be operated at a uniform speed which allows of the entire sample being ground in a period of not less than 30 seconds and not more than 90 seconds. The milled sample shall immediately be transferred to a screwcap glass jar of between 300 and 400 cubic centimeters capacity. After the jar has been properly closed by screwing the cap on tightly the contents shall be thoroughly mixed by shaking the jar for at least 30 seconds. Immediately thereafter the test cell of the Marconi apparatus shall be filled approximately half full with the milled sample and the metal plunger shall be placed into position on it. Care shall be taken to ensure that the surface of the sample is level in the cell and that the parts of the cell fit properly into one another. The cell shall be handled only by the outer insulating material surrounding it. Immediately thereafter the cell (with the metal plunger facing upwards) shall be fitted into the clamp which forms part of the Marconi apparatus and screwed tight until the two parts of the cylindrical spring housing mounted on the screw are flush. The clamp containing the cell shall have proper electric contact with the main apparatus. The switch shall now be turned to the "zero" position and the galvanometer pointer shall thereafter be adjusted by means of the "set-zero" knob above the dials until the pointer is exactly opposite the horizontal line. When setting to zero, the left-hand dial shall be at any one of the positions 1 to 5. The switch shall then be turned to the "Read" position and the dials immediately adjusted until the galvanometer pointer returns to the position of the horizontal line. The dial reading shall now be taken and the temperature be read (to the nearest degree) from the thermometer attached to the main apparatus. Any gradual movement of the pointer, after having been correctly adjusted, shall be disregarded. Not more than one minute shall elapse between the placing of the samples into the cell and the taking of the final dial readings. Whenever possible, readings shall only be

Die resultaat aldus verkry, moet vir temperatuur aangesuiwer word deur dit met 0·1 te vermeerder vir elke een graad Celsius wat die termometerlesing onder 20° Celsius is en met 0·1 te verminder vir elke een graad Celsius wat die termometerlesing bo 20° Celsius is.

Die toets moet twee keer sonder onderbreking uitgevoer word met afsonderlike hoeveelhede van die oorspronklike gemaalde monster, en indien die twee resultate aldus verkry, nie met meer as 0·3 verskil nie, word die gemiddelde daarvan as die persentasie voggehalte van die mielies waarvan die monster geneem is, uitgedruk. Indien die resultaat van die twee bepalings met meer as 0·3 verskil, moet die bepaling herhaal word met verdere hoeveelhede van die oorspronklike gemaalde monster totdat twee resultate verkry word wat nie met meer as 0·3 verskil nie.

Daar moet gesorg word dat die meul waarmee die monster gemaal word, die fles waarin dit vermeng word en die sel van die apparaat behoorlik skoon en droog is voor elke bepaling. Die vogmeter moet in ewewig met die temperatuur van die omringende lug wees om die ontwikkeling van termo-elektriese stroompies in die instrument, waardoor foute in die wyerskyflesings veroorsaak sal word, te verhoed. Om hierdie rede is dit gebiedend noodsaaklik dat die vogmeter vir 'n geruime tyd op een plek sal bly staan voordat 'n vogtoets gemaak word. Indien die vogmeter om een of ander spesiale rede na 'n ander posisie of 'n ander lokaliteit vervoer moet word, moet dit vir minstens 'n uur in die nuwe posisie met rus gelaat word sodat die instrument kans kry om in hitte-ewewig met die omringende lug te kom voordat 'n vogtoets gemaak word. Indien dit nie moontlik is om die termometer aan die kas van die instrument te heg nie, moet dit in 'n gerieflike horizontale posisie bo-op die apparaat geplaas word, minstens 15 minute voordat 'n vogtoets begin. Ook in die gevalle waar die termometer aan die kas geheg word maar dit nie permanent in daardie posisie gehou word nie, moet dit in daardie posisie geplaas word minstens 15 minute voordat 'n vogtoets begin.

Wanneer 'n vogbepaling deur middel van hierdie metode gedoen word, moet gesorg word dat die apparaat in goeie werkende toestand is deur met 'n kort stukkie draad 'n kortsluiting in die twee boonste steeksokke op die hooftoestel te maak en daarna die skakelaar op „zero“ en die galvanometernaald regoor die horizontale strepie in te stel. Nadat die skakelaar op die „lees“-posisie gestel is, moet die lesing op die wyerskywe, geneem op die wyse hierbo omskryf, ongeveer 60 wees. Die draad moet

The result thus obtained shall be corrected for temperature by increasing it by 0·1 for each degree centigrade the temperature reading is below 20° C. and by decreasing it by 0·1 for each degree centigrade the temperature is above 20° C.

The test shall be carried out in duplicate without interruption with separate quantities of the original milled sample and if the two results thus obtained do not differ by more than 0·3 the average of the two results shall be taken as the percentage moisture content of the maize from which the sample was taken. If the results of the two determinations differ by more than 0·3 the determination shall be repeated with further quantities of the original milled sample until two results are obtained which do not differ by more than 0·3.

Care shall be taken that the mill used for the grinding of the sample, the jar used for mixing the sample and the pressure cell of the apparatus are clean and dry before each determination is commenced. The moisture meter has to be in equilibrium with the temperature of the ambient air in order to obviate the generation of thermo-electric currents in the instrument which may cause errors in the dial reading. For this reason it is imperative that the moisture meter should remain in one position for an appreciable time before a moisture test is carried out. If for some special reason the moisture meter has to be moved to another position or some other locality it should be left undisturbed for at least one hour in the new position to allow the instrument to come into thermal equilibrium with the ambient air before a moisture test is carried out. If it is not possible to affix the thermometer to the case of the instrument it should be placed in a convenient horizontal position on top of the apparatus at least fifteen minutes before the moisture test is started. In those cases too, where the thermometer can be affixed to the apparatus but does not remain in that position permanently, it should be placed in that position at least 15 minutes before commencement of a moisture test.

When a moisture determination is made by means of this method it should be seen to that the apparatus is in good working order by short-circuiting the two topmost sockets on the main apparatus with a short piece of wire, and turning the switch to "zero" and adjusting the galvanometer pointer until it is opposite the horizontal line. After the switch has been turned to "Read", the reading on the dials, taken in the manner described above, should be approximately 60. The

dan verwyder word. Hierna moet die klamp soos hierbo omskryf, elektries volgens voorskrif met die hooftoestel verbind word, die skakelaar op „zero” en die galvanometernaald regoor die horizontale strepie ingestel en die basis van die toetsstel in sy normale posisie in die klamp gehou word. 'n Stukkie metaaldraad of silverpapier (tinfoolie) moet dwarsoor die blootgestelde elektrodes (die metaaldele) van die toetsel vasgedruk word sodat 'n kortsluiting veroorsaak word. Nadat die skakelaar op die „lees”-posisie gestel is, moet die lesing op die wierskywe geneem op die wyse hierbo omskryf, ongeveer 60 wees. Daarna moet die basis en isolering van die toetsel sonder die metaaldruckprop in die klamp vasgeskroef word totdat dit net stewig in posisie bly, en die skakelaar op „zero” en die galvanometer regoor die horizontale strepie ingestel word. Nadat die skakelaar nou op die „lees”-posisie gestel is, moet die lesing op die wierskywe in hierdie geval nul of laer as nul wees, maar indien die lesing hoër as nul is, kan die basis van die toetsel vir 'n paar minute in die son of in redelike warm lug geplaas en die toets herhaal word.

(b) *Brown-Duvel-metode.*—Die apparaat vir die bepaling van voggehalte volgens hierdie metode moet bestaan uit die Brown-Duvel-vogtoetsapparaat. Die verhittingskompartement, die staander, die verkoelertenk en al die toebehore van hierdie apparaat, uitgesonder die verhittingsapparaat, moet voldoen aan die spesifikasies soos uiteengesit in die „United States Department of Agriculture Bulletin, No. 1375 of 1926”. Die apparaat moet op so'n plek opgestel word dat dit nie in 'n trek staan nie. Eenhonderd gram van die monster, geneem uit die mielies waarvan die voggehalte bepaal moet word, tesame met 150 kubieke sentimeters vogtoetsolie, moet in die distilleerfles van die apparaat geplaas word. Nadat die inhoud deeglik gemeng is deur dit te skud, moet die fles toegemaak word met 'n rubberprop met die Celsiustermometer daardeur. Die termometer moet so gestel word dat presies vier vyfdes van die kwikbol onder die oppervlakte van die olie is. Die fles word dan in die apparaat geplaas en die afleibuis met die kondenseerbuis verbind sodat dit dig sluit. Die gaasdraad met asbesmiddelstuk moet in 'n goeie toestand wees. 'n Stroom koue water moet gedurig deur die kondenseertenk loop, of die tenk moet voor elke toets met koue water gevul word. Die maatsylinder, wat skoon en droog moet wees, word onder die kondenseerbuis geplaas om die water wat afgedryf word, op te vang. Die deksel word dan oor die fleshouer geplaas en met die verhitting begin. Die verhitting moet geskied deur middel van elektrisiteit, blaaslampe, alkoholbranders (spirituslampe) of gasbranders. Indien 'nvlam gebruik word, moet dit so gestel word dat dit reg onder die middel van die asbesmiddelstuk is. Die verhitting moet egalis geskied en so gereel word dat 'n temperatuur van 190° C. in minstens 19 minute en hoogstens 21 minute bereik word. Die verhitting moet dadelik gestaak word sodra die temperatuur van 190° C. bereik word. (Gewoonlik duur dit 10 minute voordat die temperatuur styg tot omrent 110° C., en nog 10 minute voordat 190° C. bereik word.)

Nadat die verhitting ophou, sal 'n geringe geleide-like styging in temperatuur plaasvind. 'n Skielike styging of daling van etlike grade in die temperatuur is 'n aanduiding dat die verhitting gedurende die laaste deel van die proses te skerp was en die toets moet dan herhaal word. As die water wat deur die afleibuis gedistilleer word, verkleur is, dui dit aan dat die graan gebrand het en dan moet die toets herhaal word.

wire shall then be removed. Thereafter the clamp shall be connected electrically with the main apparatus as described above, the switch turned to "zero", the galvanometer pointer adjusted to the position opposite the horizontal line and the base of the test cell kept in its normal position in the clamp. A piece of metal wire or silver paper (tin foil) shall be placed across the exposed electrodes (the metal parts) of the test cell and pressed down so as to cause a short circuit. After the switch has been turned to "Read", the dial reading, taken in the manner described above, should be approximately 60. Thereafter the base and the insulator ring of the test cell shall be placed in the clamp and screwed down without the plunger until they just fit tightly, the switch turned to "zero" and the galvanometer pointer adjusted to the position opposite the horizontal line. After the switch has been turned to "Read", the reading on the dials in this instance would be nil or lower but if the reading is higher than nil the base of the test cell may be exposed to sunlight or reasonably warm air for a few minutes after which the test shall be repeated.

(b) *Brown-Duvel Method.*—The apparatus for the determination of moisture content according to this method, shall consist of the Brown-Duvel moisture testing apparatus. The heating compartment, the stand, the cooling tank and all the accessories of this apparatus, excluding the heating apparatus, shall comply with the specifications set out in the "United States Department of Agriculture Bulletin No. 1375 of 1926". The apparatus shall be installed in such a position that it will not be subject to draughts. One hundred grammes of the sample of the maize of which the moisture content is to be determined, together with 150 cubic centimetres of moisture testing oil, shall be placed in the distilling flask of the apparatus. After the contents have been thoroughly mixed by shaking, the flask shall be closed with a rubber stopper through which passes the centigrade thermometer. The thermometer shall be so adjusted that exactly four fifths of the mercury bulb is immersed in the oil. The flask shall be placed in the apparatus and the delivery tube shall be connected with the condenser tube so that it fits properly. The wire gauze with asbestos centre shall be in good condition. A continuous stream of cold water shall pass through the condenser tank, or the tank shall be filled with cold water before each test. The measuring cylinder, which shall be clean and dry, shall be placed under the condenser tube to collect the water driven off. The cover shall be placed over the flask compartment of the apparatus and the heating commenced. Heat shall be applied either by means of electricity, blow lamps, spirit lamps or gas burners. If a flame is used it shall be placed in such a position that it will be beneath the centre of the asbestos-centre. Heat shall be applied evenly and be so regulated that a temperature of 190° C. is reached in not less than 19 and not more than 21 minutes. When the temperature of 190° C. is reached, the heating shall be discontinued immediately. (It usually takes 10 minutes before the temperature rises to approximately 110° C. and another 10 minutes before a temperature of 190° C. is reached.)

After the heat is turned off, a slight gradual rise in temperature will occur. A sudden increase or sudden decrease in temperature of several degrees, however, indicates that the heating was too intense during the latter part of the process and the test shall be repeated. If the water which is distilled through the delivery tubes is discoloured, it is an indication that the grain was burnt in which case the test shall be repeated.

Die deksel en termometer moet nie afgelaai word voordat die temperatuur tot 160° C. gedaal het nie. Wanneer die temperatuur 160° C. is, word die deksel afgelaai, die termometer uitgehaal en die afleibuis daarna van die kondenseerbuis losgemaak, en alle druppels water wat aan die binnekant van die maatglas kleef, afgeskud. Die hoeveelheid water onder die olielaag in die maatglas moet afgelê word in kubieke sentimeters tot een tiende van een kubieke sentimeter.

Alle bepalings moet twee keer gedoen word en indien die resultate van die twee bepalings nie meer as 0·3 kubieke sentimeter verskil nie, moet die gemiddelde van die twee resultate as die persentasie voggehalte geneem word. Indien die verskil tussen die twee resultate groter as 0·3 kubieke sentimeter is, moet die bepaling herhaal word totdat twee resultate verkry word wat nie met meer as 0·3 kubieke sentimeter verskil nie.

By die gebruik van die Brown-Duvel-apparaat moet gesorg word dat voos rubberproppe nie gebruik word nie, dat geen olie onmiddellik na 'n vorige toets weer gebruik word nie, en dat die kwikkolom in die termometer ongebroke is voordat daar met 'n toets begin word. Vir iedere toets moet of vars olie of olie wat vir geruime tyd nie gebruik is nie, gebruik word. In alle gevalle moet die olie tot 'n temperatuur van ongeveer 200° C. verhit word en eers afgekoel word voordat dit gebruik word. Indien 'n nuwe fles gebruik word, of indien die apparaat nie gedurende die voorafgaande 24 uur in gebruik was nie, moet 'n voorlopige vogbepaling eers met 'n monster mielies uitgevoer word.

Wanneer die apparaat nie gebruik word nie, moet die termometers in die flessie gehou word, en die flessie met die afleibuite verbind wees op dieselfde wyse as vir die vogtoets.

The cover and thermometer shall not be removed until the temperature has dropped to 160° C. When the temperature of 160° C. is reached, the cover shall be removed, the thermometer taken out and the delivery tube disconnected from the condenser tube and all drops of water clinging to the inside of the measuring cylinder shaken down. The quantity of water beneath the layer of oil in the measuring flask shall be read in cubic centimeters to one tenth of one cubic centimetre.

All determinations shall be made twice and should the results of the two determinations not differ by more than 0·3 cubic centimetres, the average of the two results shall be taken as the percentage of moisture content. If the results of the two determinations differ by more than 0·3 cubic centimetres, the determination shall be repeated until two results are obtained that do not differ by more than 0·3 cubic centimetres. In using the Brown-Duvel apparatus care shall be taken to avoid the use of mushy rubber stoppers, not to use oil directly from a previous test and to see that the column of mercury in the thermometer is continuous before commencing any test. Each test shall be done either with fresh oil or oil that has not been used for some time. In all cases the oil shall first be heated to a temperature of approximately 200° C. and cooled before it is used. If a new flask is used, or if the apparatus was not used at any time during the previous 24 hours, a preliminary moisture determination shall first be carried out with a sample of maize.

When the apparatus is not in use, the thermometers shall be kept in the flasks and the flasks and delivery tubes shall be connected in the same manner as when a test is made.
